

Notion Workspace — build/update specification

Purpose. The Notion MCP connector keeps dropping, so this file carries everything Notion needs. Hand it to a Claude session that *does* have Notion access, or work through it by hand. **Revised 2026-08-16** for the growth-engine pivot. **Do not create new databases.** They exist — IDs below. The job is to update.

Existing workspace

Workspace **Bonganabob's HQ** · account `hello@bonganabob.com` Hub page: **SokoLink — Mission Control** — `3b3772fd-4e22-8153-8f7d-e305ab5ba18e`

Tasks schema: Name (title), Status , Due date , Project (relation), Milestone No. (number), Branch (text), PR (url), Milestone (checkbox).

What changed, and why

The plan built the store first. **A store nobody can find is worth nothing**, and a new storefront has no audience to send to it.

So the order reverses: lead with an **AI content and growth engine** that solves a daily, felt pain, and let the store be what that audience graduates into. The live site (`biasharama11.com`) already positions it exactly this way — AI Content Engine available now, Store as the vision.

Nothing built is discarded. The Apify adapter, the Gemini seam, ownership verification, auth, the models and the working storefront all transfer. The storefront moves from "the product" to "what Growth users graduate into".

Step 1 — Projects

Rename the three pillars to match the live brand and the new order.

ROW ID	NEW NAME	STAGE	BODY
c351e0cc-bd13-4ac5-8fdb-3bd8c40b1f7a	Biashara Commerce	Planning	The store. Catalog · Orders · Payments · WhatsApp Storefront. Largely built — storefront and handoff work. Now what Growth users graduate into, not the entry point.
05a6afb4-5c1b-4935-8b74-2eeade871584	BiasharaIntel	In Progress	Analytics and competitor intelligence. The paid tier. Own-account trends, niche discovery, benchmarking, outliers. Feeds the hook corpus.
3b7772fd-4e22-81e4-9261-ea0ecd5857fb	AI Content Engine	In Progress	Hooks · Scripts · Captions · CTAs · Content ideas. The reason people sign up. Grounded in the hook corpus — the moat.

Step 2 — Tasks

Retire the P0–P9 rows (prefix [Retired – commerce-first plan] , set Done). Keep P0/P1 marked Done rather than retired: that work shipped and still stands.

Create these. Statuses: G0 `In progress` , rest `Not started` .

NO.	NAME	PROJECT	BRANCH
0	G0 — Dashboard foundation	AI Content Engine	g0-dashboard
1	G1 — My Analytics	BiasharaIntel	g1-analytics
2	G2 — BiasharaIntel: competitors	BiasharaIntel	g2-intel
3	G3 — Hooks, scripts and captions	AI Content Engine	g3-content
4	G4 — Reports and the weekly nudge	AI Content Engine	g4-reports
5	C1 — Catalogue dashboard	Biashara Commerce	c1-catalogue
6	C2 — Storefront polish	Biashara Commerce	c2-storefront
7	C3 — WhatsApp channel 🕒	Biashara Commerce	c3-whatsapp
8	C4 — Orders and payments 🕒	Biashara Commerce	c4-payments
9	P — Hardening and pilot 🕒	Biashara Commerce	p-pilot

Task bodies

G0 — Dashboard foundation - Signup / login / logout routes and pages (Jinja2 + HTMX + Tailwind) - Session cookie handling, `HttpOnly` , `current_account` dependency - Dashboard shell: navigation, empty states, account menu - Connect-account flow with bio-code verification wired to real screens - Apply the naming decision (SokoLink → Biashara Mall, if taken)

Done when: a stranger signs up in a browser, verifies a TikTok account, and lands on a dashboard.

Note: the auth **service layer exists and is tested — there are no pages**. Today a seller can only be created from Python. This is the gap.

G1 — My Analytics - Metric snapshots: views, likes, comments, shares, followers — captured per sync **as history** - Account trend: followers and total views over time - Post table: best and worst performers, sortable - "Your average" baseline that everything else is measured against

Done when: a verified creator sees their own numbers, and a second sync a day later shows a visible trend.

⚠️ **START THE TIME SERIES IMMEDIATELY.** `Product.views` is a single number overwritten each sync. It answers "how many views?" but not **"is my traction growing?"** — which is the whole question a creator pays for. A `PostMetricSnapshot` table must start filling the day this ships: **history cannot be backfilled**, and every day without it is data we can never recover.

G2 — BiasharaIntel: competitors - Spike first, and it opens the milestone: which Apify actor does keyword/hashtag creator search, what it returns, **what one search costs** - Keyword/hashtag → creators in that niche - Benchmark table against the creator's own G1 baseline - Outlier detection — the posts worth studying, and G3's input - **Persist results into the hook corpus from day one**, before generation exists

Done when: a Growth user searches a keyword and sees a ranked benchmarked list — and the same search again costs nothing.

⚠️ **Three cost guards, all required:** Growth tier only (in code, not the UI); per-seat monthly quota; result caching. Every guard is guesswork until the spike produces a real per-search cost.

G3 — Hooks, scripts and captions - Hook corpus from G2's outliers, tagged by niche, language register, performance - Hook generation grounded in the corpus + the creator's own niche - Script generation with a shot list - Caption + CTA generation in the register the niche actually uses - Content ideas as a **queue**, not a one-shot — the question is "what do I post this week" - Feedback loop: which hooks got filmed, and how they performed

Done when: a creator gets a hook, script and caption referencing real, recent, local performance — and can film from it without editing.

This is the moat. Hooks are culture- and language-bound; an English-market "viral formula" does not transfer to Nairobi. Searches feed the corpus, the corpus improves generation, better generation sells seats. A competitor can copy the feature but not the corpus.

Grounding, not training — real hooks retrieved into the prompt as examples. Fine-tuning is slower, costlier, needs data we will not have, and does not improve the instant a new hook lands.

G4 — Reports and the weekly nudge - Weekly digest: your traction, one niche trend, one ready-to-film hook - Client-facing performance report - Email now; WhatsApp when Meta verification clears

C1 — Catalogue dashboard The one genuinely missing piece of commerce. Ingestion, the price cascade, the storefront and the WhatsApp handoff all work. - Draft review queue — **low-confidence parses first**, because that is where a wrong price hides - Inline edit of price, title, sizes, stock without a reload - Publish gate visible and explained — a disabled button that says why - Manual upload path (photo → same vision agent) - Single-link ingestion (the scraper supports it; nothing calls it)

C2 — Storefront polish Built and browsable. Remaining: OG metadata for shared links, empty/error states, the shop page as an SEO surface.

C3 — WhatsApp channel 🕒 *Gated on Meta business verification — their clock.* Webhook + signature verification + **idempotency** (Meta redelivers). Conversation state, signed storefront links. Twilio evaluated if Meta stalls.

C4 — Orders and payments 🏧 Order state machine, Daraja client, **idempotent callback** — callback is truth. Checkout survives the STK prompt interrupting the browser.

P — Hardening and pilot 🏧 Rate limits, AI cost caps, secrets audit, incident-grade logs. Real Kenyan creators. One real order end to end.

Step 3 — New Decisions rows

1. Lead with the growth engine, not the store — *Product · 2026-08-16*

A store nobody can find is worth nothing, and a new storefront has no audience to send to it.

A creator who needs to know what to post **today** needs it today; a creator who needs a store needs it eventually. Content is a daily felt pain with an obvious did-it-work signal. Commerce is a decision made once you already have attention to convert.

So the product becomes an AI content and growth engine that ends in a store, rather than a store that offers content tools. Nothing built is discarded — the storefront becomes what Growth users graduate into, which is how the live site already positions it.

2. Intel is the paid tier, at \$10/month — *Product · 2026-08-16*

Published on biasharamall.com: Starter free forever (WhatsApp store + M-Pesa), Growth \$10/month (AI content engine + BiasharaIntel + priority support).

This settles a question the old plan left open. It matters because Intel is also the only feature a user can trigger repeatedly at will, so **cost now tracks revenue by design rather than by hope**.

The economics still need proving: at \$10/month a user running unlimited niche searches and video-tier drafts can cost more than they pay. G2 opens with a spike that measures the real per-search cost, because every guard is guesswork until that number exists.

3. Capture metric history from day one — *Data model · 2026-08-16*

`Product.views` is a single number overwritten on every sync. It answers "how many views does this have?" but not "**is my traction growing?**" — which is the entire question a creator is paying to answer.

A `PostMetricSnapshot` table (post, metric, value, captured_at) must start filling the day G1 ships. **History cannot be backfilled**. Every day without it is a day of data we can never recover.

Same argument as the hook corpus, and it applies sooner.

4. Canva and CapCut are destinations, not integrations — *Architecture · 2026-08-16*

The flow diagram shows Canva and CapCut, and it would be easy to read those as things we build.

We produce the words and the plan — hook, script, caption, shot list, CTA — and the creator takes them into whichever tool they already use. Canva's API is limited and CapCut has no public one; building editor integrations is a separate and much larger project.

Stated explicitly so nobody assumes it is in scope.

Step 4 — Backlog additions

ITEM	CATEGORY	PRIORITY
Canva / CapCut integrations	Idea	Low
Fine-tuning on Kenyan hooks	Idea	Low
Twilio as WhatsApp fallback	Feature	Medium
Free-tier Intel allowance	Feature	High

Free-tier Intel allowance — a free tier with zero Intel may not convert; one with unlimited Intel cannot pay for itself. A small monthly allowance is the obvious middle, but the number needs the G2 cost spike first.

Step 5 — Docs

Update **Production Plan** with the revised content from `docs/PRODUCTION_PLAN.md` . Update **Codebase** — the storefront, ingestion, media and verification all shipped since it was last written. Add a **Naming decision** doc if the rename is taken.
